Restoration is essential for improving landscape function – but where to begin? How do we restore landscapes responsibly, while balancing ecological, cultural and practical considerations?

Discover how restoration and monitoring can align with the practical realities of land management planning. This workshop will unpack the principles and goals that underpin ecological restoration, and explore practical ways to measure progress over time.

Using the International Standards for Ecological Restoration, Australian case studies and local examples, participants will put the five-star recovery wheel into practice and explore what meaningful restoration looks like on the ground.

Participants will leave with practical ideas for bringing restoration thinking and monitoring into everyday workplans, management areas and on-ground projects.
